THERMOVIT® ELEGANCE

Warmth at its most attractive

Design meets comfort

THERMOVIT® ELEGANCE is a classically elegant radiator made of glass. Purist in appearance, functional in use, innovative in its technology and design, this glass radiator provides maximum comfort and pure aesthetic pleasure in home or office, in

conservatory or bath. THERMOVIT® ELEGANCE is amazingly versatile: whether free-standing, as a non-fogging mirror or towel drier in the bath or as a room heating system – this glass radiator is a flexible, functional eye-catcher wherever it's installed.

THERMOVIT® ELEGANCE provides free rein for interior-design creativity. This glass radiator heats through direct heat radiation, which it emits evenly over the entire surface. As this stirs up no dust, the system is ideal for allergy-sufferers.

Mountings

The timeless design of the THERMOVIT® ELEGANCE extends to the high-quality mounting systems of polished (mat) stainless steel. Cylindrical holders secure the radiator firmly to the floor or the wall. Elegant stainless steel feet

make possible flexible interior design – with no installation needed. For luxuriantly warm towels, towel rails are optionally available in the lengths: 400, 500, 600, 700, 1000 and 1200 mm.

Wireless room thermostats

Control

THERMOVIT® ELEGANCE glass radiators match personal preferences precisely. The room temperature can be set to the desired value by means of a room thermostat. An uncontrolled base version is alternatively available.

Design variants

THERMOVIT® ELEGANCE skilfully melds attractive glass design with high functionality and is available in two exclusive design variations. The DIAMANT model is the classical

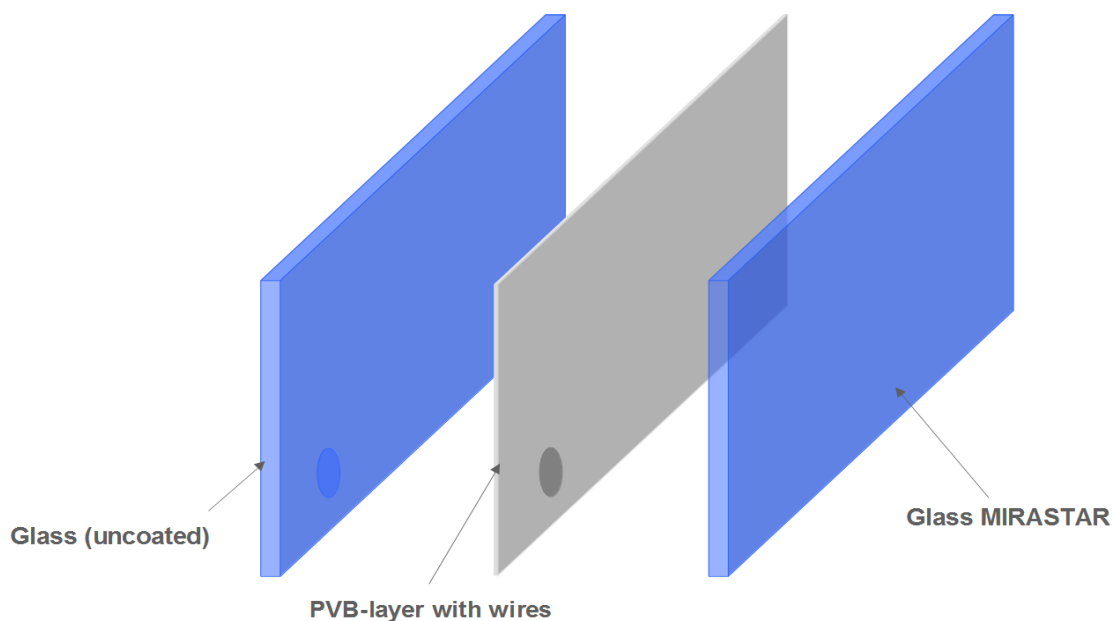

transparent version. In the MIRASTAR variant, the radiator is a non-fogging mirror that enhances the subjective size of even small rooms.

GLASS MAKE-UP (Model Diamant)

GLASS MAKE-UP (Model Mirastar)

FUNCTION

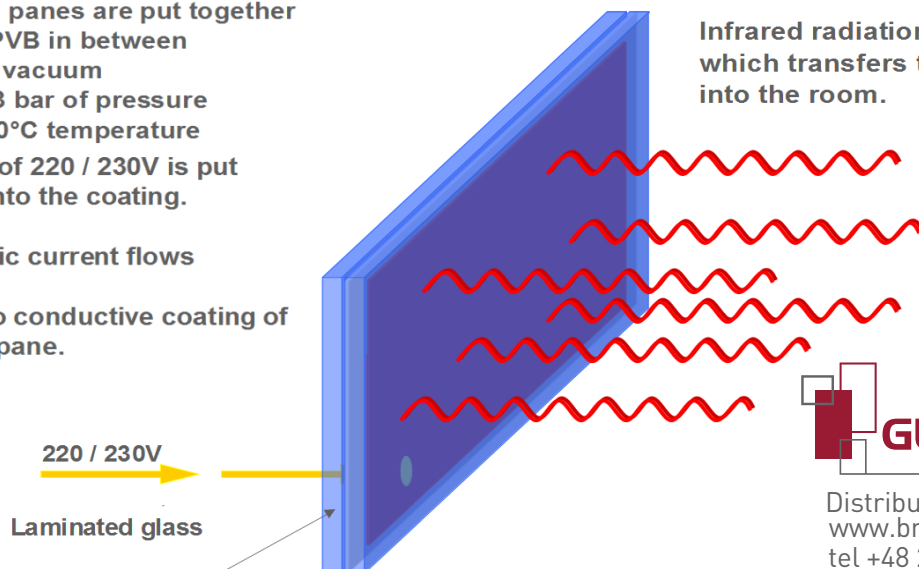

The glass panes are put together with the PVB in between

- within a vacuum
- under 13 bar of pressure
- and $>100^{\circ}\text{C}$ temperature

A voltage of 220 / 230V is put directly onto the coating.

The electric current flows through the electro conductive coating of the glass pane.

Infrared radiation is thereby created, which transfers the heating energy into the room.
